The Astronomical Journal, 169, 209, **2025**.

William Balmer is a 4th year PhD student at JHU and a valuable member of our EPSIG research group. at STScI. Their main advisor is Laurent Pueyo. Since we tend to pool resources I funded one summer of William and I also helped achieve this GTO result, pushing the inner-working angle (IWA) of the NIRCam Coronagraphy to its limits. This idea came from Marshall Perrin and Laurent Pueyo before my time at STScI but I worked on it since 2017, producing high fidelity simulations of the HR 8799 system with the bar mask and estimating the special requirement offsets needed to perform an accurate target acquisition at the narrowest end of the long-wavelength wedge mask. This paper not only demonstrates the pertinence of the "small IWA" mode but also the unique capability of NIRCam photometry to identify exoplanets that present out-of-equilibrium carbon chemistry and an enhanced metallicity. (*NASA Press Release*, *JHU Press Release*).

We pushed the limits of the VLT/NACO instrument, achieving $\leqslant 0.1\%$ accuracy in degree of linear polarization in H-band, from the ground and on a brown dwarf. This result is huge both technically and scientifically because we showed we could use polarimetry to detect the presence of cloud bands, a technique which one day will be applicable to directly imaged exoplanets.

These two highly cited papers ed by my former students are the results of the commissioning, optimization and characterization of the VLT/SPHERE/IRDIS differential polarimetry mode. This mode became the most popular to image circumstellar disks in scattered light with unprecedented details and contrast. I pushed really hard to offer it as soon as SPHERE was commissioned. High impact papers like Benisty et al. 2015 ($>$ 260 citations, first paper using the mode) were made possible by this work.

Astronomy and Astrophysics, 631, A155, **2019**.

Commissioning paper of the VLT/SPHERE instrument ($\geqslant$ 000 citations): I was instrumental in this work as I transitioned from Deputy Instrument Scientist to Lead Instrument Scientist for SPHERE at the end of the science verification in December 2014, when the instrument was offered to the community. I cowrote the User Manual and Calibration Plan and led the effort to turn it into a "science machine" that can be operated by a single, non expert staff member (operator). Today, SPHERE data have contributed to over 300 refereed publications.

Nature Astronomy, 3, 749, **2019**.

After the success we had with "molecular mapping" (Hoeijmakers et al. 2018, paper #90 here) detecting β Pictoris b using cross-correlation techniques, I had the idea to use VLT/MUSE as a high contrast imager to detect accreting protoplanets in very young circumstellar disk gaps using the Hα line. I was awarded time as PI in Science Verification to attempt this on the RXJ1615 system whose disk was first imaged with SPHERE by my PhD student Jos de Boer (paper # 63). Sebastiaan Haffert and the Leiden team in charge of the commissioning of the MUSE narrow-field of view mode (using 4 laser guide stars and tomographic adaptive optics to improve the seeing at visible wavelengths) had the same idea and observed PDS 70 at the end of commissioning, We joined efforts and it turns out PDS 70 was the perfect target for this. In this publication **now cited over 450 times** we detected a second planet (c) in the gap in addition to the one already discovered with SPHERE (b, Keppler et al. 2018, paper #87 here with over 600 citations).
